SAFETY

All units are tested to the following safety specification during manufacture:-

1. **Flash Test:** Tested at 2.2kV between live and neutral of the mains lead joined together and all accessible metal points on the exterior of the set.
2. **Insulation resistance test:** Tested between the live and neutral of the mains lead joined together and all accessible metal points on the exterior of the set to show a resistance of at least 4Mohms at 500V DC.
3. **Earth lead continuity test:** Tested for a continuity of less than 0.5ohms at 10 Amps between the earth of the mains lead and the record deck transit screw.

If there are any doubts about continued electrical safety after servicing, the above tests should be carried out.

ALIGNMENT INSTRUCTIONS

Equipment Required:

1. AM signal generator
2. FM signal generator
3. IF sweep generator with marker capabilities
4. Oscilloscope
5. VTVM
6. Nonmetallic alignment tool
7. AF oscillator
8. Frequency counter
9. Distortion meter

Important:

1. Check line voltage.
2. Set function switch to band being aligned.
3. Set the loudness switch to off.
4. Remove the antenna from the terminal.
5. Set tone control to high.
6. Connect low side of signal source and output indicator to chassis ground (unless otherwise specified).
Ground connection should be kept close to high side connection.
7. Signal input should be kept as low as possible to avoid AVC and AFC action.
(Set output indicator to high sensitivity.)
